

OPS-2A: Toolkit Scope, Non-Claims, and Misuse Matrix

EA-OC-EXTENSION / ESTRA

Abstract

OPS-2A specifies the scope-locked identity of the OPS-2 toolkit as a diagnostic-only tooling layer with terminal STOP semantics. It consolidates explicit non-claims and a misuse matrix that defines rejection patterns and STOP-triggering classes. No prescriptive, recovery, optimization, or control semantics are permitted.

1 Purpose and Scope

Purpose. OPS-2A defines the fixed identity of the OPS-2 toolkit as a tooling-level diagnostic machine. Its outputs are limited to classification, constraint checks, and STOP terminal boundary emission. OPS-2A consolidates explicit non-claims and a misuse matrix that formally rejects out-of-scope interpretations and behaviors.

Scope lock (non-extendable). The scope of OPS-2A is closed and non-extendable. Any attempt to reinterpret or widen OPS-2 beyond diagnostic-only semantics constitutes a scope violation.

Out of scope (non-exhaustive). OPS-2A excludes any prescriptive guidance, optimization, control logic, recovery procedures, or managerial advice. OPS-2A does not define new enterprise semantics, does not reinterpret ETS semantics, and does not introduce new primitives.

2 Toolkit Identity and Boundaries

2.1 Identity

OPS-2 is defined as a tooling-level diagnostic machine. Its behavior is constrained to admissibility checks, classification emission, provenance binding, and terminal STOP enforcement.

2.2 Lower boundary

OPS-2 does not define or alter the underlying enterprise semantics, predicates, or phase logic. Any semantic authority remains outside OPS-2 and cannot be introduced through tooling.

2.3 Upper boundary

OPS-2 does not prescribe actions, recommend changes, optimize objectives, or provide control-loop behavior. Any attempt to induce ‘you should do X’ from diagnostic outputs is rejected.

2.4 Category-exclusion firewall

OPS-2 explicitly blocks prohibited categories (prescription, recovery, optimization, control, scope extension, semantic drift) and treats them as STOP-triggering misuse patterns under the consolidated matrix.

3 Non-Claims and Misuse Matrix

3.1 Canonical Non-Claims (Scope-Locked)

3.2 STOP Terminality and Dominance (Consolidated)

3.3 Misuse Taxonomy (Definitive Rejection Classes)

3.4 Compact Misuse Matrix

3.5 Definitive Rejection Statements (Paste-Ready)

4 Conformance and STOP Integrity

STOP terminality. STOP is treated as a first-class terminal epistemic boundary. Once STOP applies for a declared case, no further diagnostic emission is admissible for that case.

Conformance-first discipline. Any detected misuse pattern within OPS-2A scope is treated as a conformance failure and is classified as STOP-triggering behavior. No corrective actions, mitigations, or recovery recommendations are permitted within OPS-2A.

Non-extendability. OPS-2A is constitutive: it defines boundaries rather than offering paths around them.

5 Evidence and Provenance Boundary

No evidence inflation. OPS-2A does not generate, aggregate, or upgrade evidentiary strength. Any attempt to “manufacture” confidence (e.g., by repeated restatement, implied benchmarking, or optimization claims) is out of scope and constitutes misuse.

Provenance minimum. OPS-2A outputs MAY include minimal provenance sufficient for traceability, such as: artifact identifier/version, timestamp, declared scope label, and the applied conformance classification (OK vs. STOP). OPS-2A MUST NOT infer or fabricate missing provenance fields.

No external validation claims. OPS-2A MUST NOT claim independent verification of builds, hashes, signatures, third-party audits, or empirical validation unless such evidence is explicitly provided as input.

6 Interface and I/O Contract

Admissible inputs. OPS-2A MAY accept only user-provided artefacts and metadata sufficient to classify scope conformance. Admissible inputs include: plain text excerpts, file paths or identifiers

(as strings), declared artefact labels/versions, and explicitly provided provenance fields. OPS-2A MUST treat all missing provenance as unknown and MUST NOT infer it.

Bounded outputs. OPS-2A outputs are limited to: (i) a scope label (OPS-2A), (ii) a conformance classification (OK vs. STOP), and (iii) a minimal, non-prescriptive rationale describing which boundary was crossed (if any). OPS-2A MUST NOT output recommendations, remediation steps, prioritization, roadmaps, or any action guidance.

No control-loop semantics. OPS-2A MUST NOT be used as a control surface. Repeated querying, iterative refinement, or goal-seeking behavior aimed at avoiding STOP is classified as misuse and is STOP-triggering.

No hidden state. OPS-2A is stateless with respect to cases: it MUST NOT assume continuity across runs unless the user explicitly provides the prior artefact content as input. No memory-based completion or retrospective reconstruction is permitted.

7 Misuse Patterns and STOP Triggers

Action-seeking misuse. Requests for prescriptions, optimization, prioritization, rollout plans, or managerial advice are out of scope. Such requests MUST be classified as STOP within OPS-2A.

Evidence inflation misuse. Any prompt attempting to upgrade confidence without provided evidence (e.g., “confirm it is correct”, “prove it works”, “benchmark it”, “certify compliance”) is out of scope and MUST be classified as STOP unless the required evidence is explicitly included as input.

Control-loop misuse. Iterative prompts intended to “get around” STOP, to search for loopholes, or to refine outputs toward an operational goal constitute misuse and MUST be classified as STOP.

Scope creep. Any attempt to extend OPS-2A into OPS-1 execution semantics, OPS-0 enforcement surfaces, or enterprise-operational recommendations is out of scope and MUST be classified as STOP.

8 Relationship to OPS-0 and OPS-1

Non-substitution. OPS-2A does not replace OPS-0 (operational semantics contract) nor OPS-1 (engine core). OPS-2A is limited to scope labeling, non-claims, and misuse classification.

No reinterpretation. OPS-2A MUST NOT reinterpret, relax, or extend OPS-0/OPS-1 semantics. If an input requires OPS-0/OPS-1 interpretation beyond the provided text, OPS-2A MUST classify as STOP.

Boundary consistency. When OPS-0/OPS-1 declare STOP as terminal, OPS-2A mirrors this as a conformance boundary: OPS-2A may only classify, not operationalize, mitigate, or route around STOP.

9 Limits and Non-Goals

OPS-2A explicitly does *not*:

- provide remediation, fixes, recommendations, or action plans;
- optimize processes, KPIs, or decision outcomes;
- generate evidence, benchmarks, audits, or validation claims;
- infer missing provenance, reconstruct history, or assume hidden context;
- function as an execution engine, workflow orchestrator, or control loop.

All such requests are classified as misuse within OPS-2A scope and are **STOP**-triggering.

10 Appendix: Minimal Conformance Checklist

1. Is the output limited to (scope label, OK/STOP classification, minimal rationale)?
2. Are there *no* recommendations, remediations, or operational next steps?
3. Is STOP treated as terminal (no “if you do X, you can proceed”)?
4. Is all provenance either provided or explicitly marked unknown (no inference)?
5. Are any attempts at evidence inflation classified as misuse/STOP?
